Parsing

MegaParsec : for this project we decided to use the MegaParsec library because of it's error handling and wide documentation, making it easier.

Lexing

This is what's used after the parser to go through every part of the code and assign each of it to functions?

AST

The abstract ayntax tree is a function that has been made to handle every lisp's keyword.

Testing

We've used unit test using hUnit and functional test using Python to cover as much possibilities as possible.
